SCHOOL OF COMPUTER SCIENCE AND ARTIFICIAL INTELLIGENCE		DEPARTMENT OF COMPUTER SCIENCE ENGINEERING	
Program Name: B. Tech		**Assignment Type:** Lab	**Academic Year:** 2025-26
Course Coordinator Name	Dr.Vairachilai Shenbagavel		
Instructor(s) Name	Srinivas Komakula		
Course Code	23CA201SE402	**Course Title**	Explainable AI (P)
Year/Sem	III/V	**Regulation**	R24
Date and Day of Assignment	28-07-2025	**Time(s)**	09:00AM -05:00PM
Duration	2 Hours	**Applicable to Batch**	**23CSBTB44**
Assignment Number: 01			

Q. No.	Question	Expected Time to complete
1	Green Cycle – E-Bike Company	

Context:

Green Cycle tracks how many social media reels affect demo test ride bookings.

Instagram Reels (x)	Test Rides (y)
1	20
2	35
3	48
1	25
2	38

Objective:

Analyze the effect of Instagram reel postings on the number of test ride bookings for Green Cycle by performing Linear Regression and interpreting SHAP values.

Requirements:

1. **Perform Linear Regression Analysis**
   - Use the given dataset where:
     • Independent Variable (x): Instagram Reels
     • Dependent Variable (y): Test Rides
2. **Calculate the Baseline Value**
   - Compute the mean of all test ride values (y values).
3. **Calculate SHAP Values**
   - For each record, calculate the difference between the predicted value and the baseline.
   - This difference is the SHAP value, attributed to the number of Instagram reels.
4. **Compute Final Prediction**
   - Use the linear regression model to calculate predicted test rides for each reel count.
   - Confirm that:
     Final Prediction = Baseline + SHAP Value
5. **Interpret the Results**
   - Explain how the number of Instagram reels influenced each predicted test ride count.
   - Compare the predicted value to the actual value for each row.
   - Identify under prediction or over prediction, and provide reasoning.

Deliverables:

A notebook or document containing:

- Linear regression implementation with coefficients
- Baseline (mean of y)
- Table of SHAP values and predictions
- Explanation of how each input influenced the prediction
- Comparison of predicted vs actual values, with over/under prediction notes
- Summary analysis covering:
  - Accuracy of the model
  - Trend analysis
  - SHAP interpretation insights

Q. No.	Question	Expected Time to complete
2	**EduSmart – Subscription Renewals using Multiple Linear Regression and SHAP Analysis**	

Objective:

Assess the impact of resolved customer support tickets and in-app messages on subscription renewals using Multiple Linear Regression and interpret results using SHAP values.

Given Dataset:

Tickets Resolved (x_1)	In-App Messages (x_2)	Renewals (y)
10	5	70
12	3	60
15	6	80
8	2	50
7	4	55

Tasks:

1. **Perform Multiple Linear Regression Analysis**
   - Independent variables: Tickets Resolved and In-App Messages
   - Dependent variable: Renewals
2. **Compute the Baseline Value**
   - Use the average of the renewals
3. **Calculate SHAP Values**
   - Calculate SHAP Value
   - Distribute SHAP contributions between Tickets and Messages
4. **Compute Model Predictions for Each Record**
   - Apply the regression equation
   - Ensure SHAP decomposition: Prediction = Baseline + SHAP(Tickets) + SHAP(Messages)
5. **Interpret the SHAP Contributions**
   - For each record, explain the role of each input
   - Compare actual vs predicted renewals
   - Comment on overprediction or underprediction and justify it using SHAP

Q. No.	Question	Expected Time to complete
3	**Regression with Diabetes Dataset**	

Objective:

Understand how patient features influence disease progression using Multiple Linear Regression and SHAP value analysis.

Tasks

1. Perform Multiple Linear Regression Analysis

- Use all available features from the Diabetes dataset as independent variables.
- Fit a Multiple Linear Regression model to predict disease progression.

2. Calculate the Baseline Value

- Compute the **mean** of the target variable (disease progression scores) from the training data.
- This will serve as the **baseline prediction**.

3. Calculate SHAP Values

- Apply SHAP to compute **feature contributions** to each prediction.
- Use model coefficients to proportionally attribute the difference from the baseline to each feature.

4. Compute Final Prediction for Each Record

- For every test record, verify that:

Prediction = Baseline + SHAP(Feature$_1$) + SHAP(Feature$_2$) + ... + SHAP(Feature$_n$)

5. Interpret the Results

- For each patient record:
  - Explain how each feature contributed to the predicted disease progression.
  - Compare the **predicted value** vs the **actual observed value**.
  - Comment on whether the model **overpredicted or underpredicted** and **why**, based on SHAP values.

Q. No.	Question	Expected Time to complete
4	**Regression with Student Performance Dataset**	

Objective:

Investigate how student background and behavior influence final exam scores using Multiple Linear Regression and SHAP value analysis.

Tasks

1. Perform Multiple Linear Regression Analysis

- Use all relevant student attributes (e.g., study time, parental education, absences, etc.) as independent variables.
- Fit a regression model to predict the **final exam score**.

2. Calculate the Baseline Value

- Compute the **mean of the final exam scores** from the training set.
- This serves as the **baseline prediction** (expected value).

3. Calculate SHAP Values

- Use SHAP to compute the contribution of each student attribute to the final exam score prediction.
- Distribute the prediction deviation from the baseline among the features.

4. Compute Final Prediction for Each Record

- For each student record, confirm:

Predicted Score = Baseline + SHAP(Feature$_1$) + SHAP(Feature$_2$) + ... + SHAP(Feature$_n$)

5. Interpret the Results

- For every prediction:
  - Explain how different features (e.g., study time, failures, health) impacted the exam score.
  - Compare predicted score to actual score.
  - Comment on overprediction or underprediction and possible reasons behind it.
